Introduction. Optics has had a very long and full history, from ancient Greece, through the renaissance and modern times. As with optics, acoustics has a history of similar duration, again starting with the ancient Greeks. In contrast, the acousto-optic effect has had a relatively short history, beginning with Brillouin predicting the diffraction of light by an acoustic wave, being propagated ...

Acousto-optics - Wikipedia

An Acousto-Optic (AO) device is essentially an optical cell with an ultrasonic transducer (generally in the 10s/100s MHz region) bonded to one of its faces. The acoustic beam creates a sinusoidal perturbation of the refractive index of the medium due to the photoelastic effect which acts as a volume diffraction grating.

This book describes the design considerations for acousto-optic devices, including materials, transducers, geometry, principles of operation, and engineering tradeoffs. The presentation is sufficiently detailed and clear that readers could design and build their own AO device (if they have a clean room and can lay their hands on a large chunk of ultrapure lithium niobate).

In laser printers and other devices, an AOM can be used for modulating the power of a laser beam. The modulation may be continuous or digital (on/off). Main Acousto-optic modulation principles. The proper Bragg angle for each device is tabulated on the individual data sheets. Second, the modulator must be translated vertically so the optical beam passes through the acoustic beam. This adjustment is more critical for the high-performance (wideband) units which have acoustic beams of very small height.

Acousto-Optic

First-principles acousto-optic simulation in time domain has been challenging due to the fact that the acoustic and optical frequencies differ by many orders of magnitude. We bypass this difficulty by formulating the interactions between the optical and acoustic waves rigorously as a system of coupled nonlinear

equations in frequency domain.

An acousto-optic modulator, also called a Bragg cell or an acousto-optic deflector, uses the acousto-optic effect to diffract and shift the frequency of light using sound waves. They are used in lasers for Q-switching, telecommunications for signal modulation, and in spectroscopy for frequency control. A piezoelectric transducer is attached to a material such as glass. An oscillating electric signal drives the transducer to vibrate, which creates sound waves in the material. These can be thought
