An n-gram model is a type of probabilistic language model for predicting the next item in such a sequence in the form of a (n – 1)–order Markov

model. n-gram models are now widely used in probability, communication theory, computational linguistics (for instance, statistical natural language processing), computational biology (for instance, biological sequence analysis), and data compression.

We build classification models with logistic regression and random forest using features from N-gram IDF and topic modeling, which is widely used in various software engineering tasks. With a publicly available dataset, our results show that our N-gram IDF-based models have a superior performance than the topic-based models on all of the evaluated cases.

An especially simple yet very powerful concept for the formal description of statistical language models is formed by their representation using Markov chains or so-called n-gram models. A statistical n-gram model corresponds to a Markov chain of order n–1. The probability of a certain symbol sequence is decomposed into a product of conditional probabilities while limiting the context to n–1 predecessor symbols.
