Interaction Between Reinforcing Geosynthetics And

The test results show that the geosynthetic pull-out force in tire chip and soil-tire chip backfills increases with displacement—i.e., no peak pull-out force is generally obtained, at least for displacements ≤ 100 mm. Pull-out interaction coefficients for tire chip backfills are typically greater than 1, whereas for soil-tire chip backfills they typically range between 0.2 and 0.7, even though the pull-out capacity for soil-tire chip backfills is generally similar to or greater than the ...

On the other hand, Tatlisoz et al. (1998) evaluated the interaction coefficients between geosynthetic reinforcement and fill material, which were tire chips, sand, and rubber-sand mixtures. The interaction coefficients greater than 1.0 indicate that there is an efficient bond between the fill and the geosynthetic reinforcement, and usually occur when resistance is provided by strike-through and restrained dilatancy.

Soil-reinforcement interaction is one the governing factors in the design of reinforced soil structures. This interaction between soil and geosynthetic materials is influenced by interfacial frictional forces developed between soil and geosynthetic material.

Large direct shear testing to evaluate the interaction ...

When designing reinforced earth structures, a vital aspect is to understand the interaction between the reinforcement and the compacted soil as this governs the overall stability. The main function of the reinforcement is to redistribute the stresses within the soil structure in order to enhance the internal stability of the reinforced soil structure.

Geosynthetics: Applications, Design and Construction

Tests were conducted with and without geosynthetic reinforcement to evaluate how deflection of the working platform is affected by the presence of reinforcement, type of reinforcement, and thickness of the working platform. Four different geosynthetics were used: geogrid, woven geotextile, nonwoven geotextile, and drainage composite.
