In mathematics and physics, perturbation theory comprises mathematical methods for finding an approximate solution to a problem, by starting from the exact solution of a related, simpler problem. A critical feature of the technique is a middle step that breaks the problem into "solvable" and "perturbative" parts. Perturbation theory is widely used when the problem at hand does not have a

known exact solution, but can be expressed as a "small" change to a known solvable problem. Perturbation theory

Perturbation theory primarily solves the problem of existence of an invariant manifold of system (1.1) of the form $M(E): X = f(o) + U(C_p, E)$, (PE Tm, (1.4) $u \in CS(q|x C(f), u(tp,O) 3 0$, for small E . Here, $l = [0, \sim 1, Ed > 0$ is sufficiently small, and $r 2 \leq 2 1$.

Dynamic systems theory studies the behavior of systems that exhibit internal states that evolve over time (i.e., internal dynamics) and how

these systems interact with exogenously applied input (often referred to as perturbations).

Key words: Filippov systems, singular perturbation, tangency points. 1. Introduction Non-smooth dynamical systems (or Filippov systems) occur in various situations like mechanical systems with dry friction or with impacts. They also appear in control theory, electronic, economics, medicine and biology (see for instance [1], [3], [6] and [7]).
