The analysis of pile-soil interaction under lateral loading has always been a concern. A comparative study to analyze pile-soil interaction under lateral loading was conducted. A 2D finite difference method model was developed using LPILE, 2012. The soil was assumed to be stiff clay without free water with a unit weight of 2001.2 kg/m³. The pile is oriented such that bending is about the weak axis.

For the two buildings described, the axial interaction between soil and pile has been determined in detail according to an estimate of the foundation capacity and working load of the piles. For these buildings, the calculated interaction level z / L is in good agreement with the measured values. In most cases in practice, no detailed information is present about the foundation, but it would be practical to estimate the amount of interaction according to generally known building

characteristics.

Soil-structure
interaction is the key
to study the behavior
of structures under
static or dynamic
loading. The pile
foundation is adopted
to transfer loads from
the structure to the soil
when the structure is
embedded in a weak
soil stratum. Soil-pile
system has a nonlinear
behavior; thus, it is
more complicated to
understand.

Abstract Interaction between soil and an elastic pile vibrating horizontally is theoretically examined. The soil is modelled as a linear, viscoelastic layer overlying rigid bedrock. The pile is assumed to be vertical and point bearing.

Soil-pile interaction in horizontal vibration - Novak ...

The soil-structure interaction of piles used to stabilize failing slopes (i.e., subjected to lateral soil movement known as passive piles) was experimentally investigated using a state-of-the-art soil-structure interaction facility. A 102-mm diameter, 1.58-m-long precast concrete pile was installed in well-graded sand. The pile

was instrumented with displacement and tilt gauges at the pile head and strain gauges, a flexible shape acceleration array, and thin tactile pressure sheets along the ...

The stiffnesses of the pile-soil interaction springs K_h are determined based on the spacing of the spring as follows: (8) $K_h = k_h \cdot D \cdot s$ where s is the spacing of the pile-soil interaction springs. A viscous dashpot damping model is adopted for considering the energy dissipation during excitation.

Once the interaction factor has been obtained, the settlement S_i of a pile i due to its own load and due to an adjacent loaded pile j , can be expressed as follows:
 (1) $S_i = P_i / K_i + \alpha_{ij} \cdot P_j / K_j$ where P_i is the load on pile i , K_i is the axial head stiffness of pile i , α_{ij} is the interaction factor for effect of pile j (influencing loaded pile) on pile i (influenced pile), P_j is the load on pile j and K_j is the axial head stiffness of pile j .

During pile-soil interaction, a negative correlation exists between the damping ratio of the soil near the pile and shear

Soil-structure interaction plays an important role in the behavior of structure under static or dynamic loading. It influences the behavior of soil, as well as the response of pile under loading. The analysis is highly essential for predicting a more accurate structural behavior so as to improve the safety of

structures under extreme loading conditions.

In addition, pile-cap displacements, influence of bridge higher modes and VC effects on Soil-Pile-Superstructure Interaction (SPSI) relations are investigated with respect to frequency content of the ground motion. The kinematic and inertial SPSI effects on seismic isolation systems including VC are also explored comparatively.

The approach of Poulos and Davis for obtaining the pile-pile interaction factor considers a pair of vertical piles spaced at (S) and embedded in a horizontally layered soil. The formulation is based on the additional settlement of a pile under the interaction of the other pile. Poulos proposed another approach that can be used for calculating the additional settlement of a pile caused by a ...
