This new textbook seeks to promote a deep yet accessible understanding of mesoscale-convective processes in the atmosphere.

Mesoscale-convective processes are commonly manifested in the form of thunderstorms, which are fast evolving, inherently hazardous, and can assume a broad range of sizes and severity. Modern explanations of the convective-storm dynamics, and of the related development of tornadoes, damaging "straight-line" winds, and heavy rainfall, are provided.

Mesoscale-convective processes are commonly realized in the form of thunderstorms, which are dynamic, fast evolving, and assume a broad range of sizes and severity. Indeed, convective storms have the potential to spawn tornadoes and generate damaging "straight-line" winds, and are additionally responsible for the rainfall that can be both detrimental but also immensely beneficial to society.

Mesoscale meteorology is the study of weather systems smaller than synoptic scale systems but larger than microscale and storm-scale cumulus systems. Horizontal dimensions generally range from around 5 kilometers to several hundred kilometers. Examples of mesoscale weather systems are sea breezes, squall lines, and mesoscale convective complexes. Vertical velocity often

equals or exceeds horizontal velocities in mesoscale meteorological systems due to nonhydrostatic processes such as buoyant acc

Mesoscale meteorology - Wikipedia

A mesoscale convective system (MCS) is a complex of thunderstorms that becomes organized on a scale larger than the individual thunderstorms but smaller than extratropical cyclones, and normally persists for several hours or more.
