The motion of a rocket is essentially an effect of the conservation of momentum. That is, for a given isolated system, the total momentum will remain constant. Thus, if the main part of the rocket gains any speed in a given direction, it can only come from ejecting fuel with some velocity in the opposite direction.

In fact, rockets work more efficiently in space than in an atmosphere. Multistage rockets are capable of attaining escape velocity from Earth and therefore can achieve unlimited maximum altitude. Compared with airbreathing engines, rockets are lightweight and powerful and capable of generating large accelerations. To control their flight, rockets rely on momentum, airfoils, auxiliary reaction engines, gimballing thrust, momentum
