To prove that purifying selection drove the evolution of the PIN1 protein-coding sequences, we calculated average dN and dS values for the sequences within the phylogenetic tree (Figure 1). The average dN and dS values are 0.164 and 0.612, respectively, and the average dN/dS value is 0.268, supporting that angiosperm PIN1 sequences were subjected to purifying selection during evolution.

In biology, phylogenetics /ˌfaɪloʊdʒəˈneɪtɪks, -lə/ is a part of

systematics that addresses the inference of the evolutionary history and relationships among or within groups of organisms. These relationships are hypothesized by phylogenetic inference methods that evaluate observed heritable traits, such as DNA sequences or morphology, often under a specified model of evolution of these traits. The result of a molecular phylogenetic analysis is expressed in a

phylogenetic tree. Molecular phylogenetics is one aspect of molecular systematics, a broader term that also includes the use of molecular data in taxonomy and biogeography. Molecular phylogenetics and molecular evolution correlate. Molecular

evolution is the process of selective changes (mutations) at a molecular level (genes, proteins, etc.) throughout various branches in the tree of life (evolution).
