$V_A - F_v + V_B + V_C = 0$ $\Sigma H = 0: H_A = 0$ $\Sigma M_A = 0: F_v \cdot a - V_B \cdot (a + b) - V_C \cdot (a + b + c) = 0$. Since there are four unknown forces (or variables) (V_A , V_B , V_C and H_A) but only three equilibrium equations, this system of simultaneous equations does not have a unique solution. The structure is therefore classified as statically indeterminate.

Statically indeterminate - Wikipedia

CBeam Description. C-beam is a continuous beam software package that allows the user to solve statically indeterminate structures. The application uses a stiffness matrix method of analysis to calculate analytical results accurately and

precisely. Cbeam is a powerful timesaving tool for engineers and designers, which makes the calculation of Reactions, Deflections, Shear and Moments extremely easy, accurate, fast, and user friendly.

CBeam - Continuous Beam Analysis Software

An indeterminate structure is one whose unknown forces cannot be determined by the conditions of static equilibrium alone and will require, in addition, a consideration of the compatibility conditions of different parts of the

structure for its complete analysis. Furthermore, structures must be stable to be able to serve their desirable functions.
