Cardiac Arrhythmias**

Catheter ablation with radiofrequency or cryothermal energy is an important therapy for the management of tachyarrhythmia, including atrial tachycardia, atrioventricular (AV) re-entrant tachycardia and AV nodal re-entrant tachycardia. Improvements in cryoballoon technology have led to shorter procedural and fluoroscopy times with similar efficacy and complication rates.

Radiofrequency (RF) catheter ablation depends upon the

conversion of electrical energy to tissue heat that results in thermal injury and necrosis of the targeted arrhythmogenic tissue. Tissue heating results in damage to the sarcolemmal membrane, nonspecific poration, and calcium overload leading to cell death.

A catheter ablation involves passing thin, flexible tubes, called catheters, through the blood vessels to the heart. The catheters record the heart's electrical activity and can pinpoint where the arrhythmia is coming from. For around 90 per cent of those who have it, catheter ablation is successful

Catheter Ablation of Cardiac Arrhythmias - 3rd Edition

Ablation, also known as catheter ablation, is a treatment that aims to control or correct certain types of abnormal heart rhythms. It uses either heat (radiofrequency ablation) or freezing (cryoablation) on the area of your heart

that's causing the abnormal heart rhythm (or arrhythmia). This treatment creates scar tissue which:

Transvenous catheter ablation of cardiac arrhythmias was first described in the 1980s. 1,2 In 1998, Haïssaguerre et al.³ introduced catheter ablation as a treatment option for atrial fibrillation (AF), which today is the dominating procedure in the majority of institutions.

Catheter ablation is a procedure that uses radiofrequency energy (similar to microwave

heat) to destroy a small area of heart tissue that is causing rapid and irregular heartbeats. Destroying this tissue helps restore your heart's regular rhythm. The procedure is also called radiofrequency ablation.

BACKGROUND:

Catheter ablation has become a mainstay in the treatment of a wide range of cardiac arrhythmias.

Catheter Ablation for Cardiac Arrhythmias: Utilization and ...

Cardiac ablation usually uses long, flexible tubes (catheters) inserted through a vein or artery in your groin and threaded to your heart to deliver energy in the form of heat or extreme cold to modify the tissues in your heart that cause an arrhythmia. Cardiac ablation is sometimes

done through open-heart surgery, but it's often done using catheters, making the procedure less invasive and shortening recovery times.
