Many brittle, amorphous materials such as thermosetting polymers and silica-based inorganic glasses show some tell-tale markings on their fracture surfaces (Mecholsky et al., 1977; Chandan et al., 1994). Typically, the fracture surface of a glass fiber shows four distinct regions.

Inorganic Glass - an overview | ScienceDirect Topics

Inorganic glass is an amorphous, hard, brittle, transparent, and super-cooled liquid of infinite viscosity. It is manufactured by fusing a mixture of number of metallic silicates. The term Inorganic is added with glass because a glass is a mixture of inorganic compounds such as silicates of sodium, potassium, calcium, and lead.

A ceramic is any of the various hard, brittle, heat-resistant and corrosion-resistant materials made by shaping and then firing a nonmetallic mineral, such as clay, at a high temperature. Common examples are earthenware, porcelain, and brick.. The crystallinity of ceramic materials ranges from highly oriented to semi-crystalline, vitrified, and often completely amorphous (e.g., glasses).

Ceramic - Wikipedia

XRD patterns of commercial melted glass and wet synthesized inorganic polymer were compared showing broad peaks between 17 and 34 2θ (typical for amorphous phases) which for inorganic polymer is slightly shifted to the higher 2θ revealing questioningly its relatively more “dense” structure than that for analogous commercial glass.

Special glassy materials and their properties

Acrylic glass, poly(methyl methacrylate), is a polymer, fitting the description of glass by being an amorphous solid. Acrylic glass has a very similar refractive index to silica glass (~1.5) and is physically lighter, softer, and more shatter-resistant than glass. [3] Polycarbonates is another class of optically transparent polymers.

The amorphous materials laboratory (amoLab) is focused on novel amorphous materials for innovative technologies, including Phase-Change Materials for future non-volatile phase-change memory devices and 3D-printed amorphous metals (bulk metallic glasses) for structural applications. With synchrotron X-rays/neutron scattering and state-of-the-art thermal analytical techniques, we investigate the atomic-scale structure, thermodynamics, and kinetics of amorphous states of these materials.

Thus the inclusion of materials in this volume is selective rather than exhaustive. In the case of commercial optical glasses, for example, properties of representative types of glasses are given but not properties for all compositional variations. Glasses with special properties or for special applications are included, however.

What is the difference between glassy and amorphous?

Glass is a solid inorganic material that we use in our daily life while crystals are solids that have ordered structures and symmetry. The key difference between glass and crystal is that glass has an amorphous structure whereas crystal has a crystalline structure.

Obsidian, a volcanic glass with the same chemical composition as granite (typically KAlSi_3O_8), tends to have curved, irregular surfaces when cleaved. Crystalline solids, or crystals, have distinctive internal structures that in turn lead to distinctive flat surfaces, or faces.
