1 Introduction Bicycle Dynamics Bicycle and motorcycle dynamics is the science of the motion

of bicycles and motorcycles and their components, due to the forces acting on them. Dynamics falls under a branch of physics known as classical mechanics.

Bike motions of interest include balancing, steering, braking, accelerating, suspension activation, and vibration. The study of these motions began in the late 19th century and continues today.

The steer tilt is $\pi/2$ minus the conventional “head angle”; a bicycle with head angle of 72° has $\lambda = 18^\circ = \pi/10$. The steer axis location is implicitly defined by the wheel base w , trail c and steer axis tilt

angle λ . Two non-design parameters are the downwards gravitational acceleration g and the nominal forward speed v .

Start with the 24 degrees of freedom of the 4 rigid bodies, each with 3 translational and 3 rotational degrees of freedom in physical space ($4 \times (3 + 3) = 24$). Then subtract out 5 degrees of freedom for each of the three hinges and one more for each wheel touching the ground plane: $24 - 3 \times 5 - 2 = 7$.

An advanced model of bicycle dynamics

Over the past 140 years, scores of other people have studied bicycle dynamics, either for a dissertation, a hobby or sometimes as part of a life's work on vehicles. This sparse and varied research on the dynamics of bicycles modelled as linked rigid bodies was initially reviewed in Hand (1988).
