Heat Pipe Design and Technology | SpringerLink

A heat pipe is a heat-transfer device that combines the principles of both thermal conductivity and phase transition to effectively transfer

heat between two solid interfaces. At the hot interface of a heat pipe, a liquid in contact with a thermally conductive solid surface turns into a vapor by absorbing heat from that surface. The vapor then travels along the heat pipe to the cold interface and condenses back into a liquid, releasing the latent heat. The liquid then returns to the hot interface.
