If the shear wall design is done without considering the wall frame interaction, the manual calculation can also be used

to analyze the shear walls In this method, the lateral load shall be applied on each wall based their stiffness. That means the total load shall be divided amount the walls based on their stiffness.

The calculated results (F pc) increase to 62.5 kN, 64.5 kN, and 64.5 kN, when the shear strength of the screw connections

for both layer wallboards are accumulated without strength reduction in the gypsum wallboards; the ratios of the calculated results (F pc) to the test results (F pt) are 0.86, 0.69, and 0.69 with a considerable safety assurance.

The results obtained show that, for a same scale of test, the friction angle

does not vary significantly within a RE wall: between the upper part and the middle part in the case of standard shear box tests (about 44°) and between the intralayer and the interlayer in the case of full-scale shear box tests (37.3° and 34.8°, respectively).

The results in Table 3 indicate that shear walls with slit configurations 4, 5 and 6 have good structural performance with highly improved ductility while maintaining relatively high shear strength and stiffness compared with other slit configurations and the unperforated shear walls. Test results were discussed and compared with T-shaped steel-concrete composite shear wall. Results mainly showed that the T-shaped shear wall specimens mainly presented bending-shear failure mode and were all destroyed because of the concrete crushing at the web (negative direction) and the longitudinal reinforcement of the web reaching the limited deformation (positive direction), showing that the

web was the weakest part of T-shape shear wall.
