A Bayesian network is a probabilistic graphical model that represents a set of variables and their conditional dependencies via a directed acyclic graph. Bayesian networks are ideal for taking an event that occurred and predicting the likelihood that any one of several possible known causes was the contributing factor. For example, a Bayesian network could represent the probabilistic relationships between diseases and symptoms. Given symptoms, the network can be used to compute the probabilities

Things that we know (evidence) can be set on each node/variable in a Bayesian network. For example, if we know that someone is a Smoker, we can set the state of the Smoker node to True. Bayesian networks satisfy the local Markov property, which states that a node is conditionally independent of its non-descendants given its parents.
