On The Alternation Of Generations

Alternation of generations is defined as the alternation of multicellular diploid and haploid forms in the organism's life cycle, regardless of whether or not these forms are free-living. In some species, such as the alga *Ulva lactuca*, the diploid and haploid forms are indeed both free-living independent organisms, essentially identical in appearance and therefore said to be isomorphic.

Alternation Of Generations | Definition of Alternation Of ...

The term alternation of generations is used to describe an alternation of forms in the life cycle of plants and some protists. One form is diploid, with $2n$ chromosomes: the sporophyte. The

other form is haploid with only one set of chromosomes: the gametophyte. Both forms are multicellular. In sexual reproduction, organisms have a haploid phase with one set of chromosomes and a diploid phase with two sets of chromosomes. In animals the body is usually diploid, while the haploid stage is only the
