About this book. This research monograph presents results to researchers in stochastic calculus, forward and backward stochastic differential equations, connections between diffusion processes and second order partial differential equations (PDEs), and financial mathematics. It pays special attention to the relations between SDEs/BSDEs and second order PDEs under minimal regularity assumptions, and also extends those results to equations with multivalued coefficients.

Stochastic calculus and stochastic differential equations (SDEs) were first introduced by K. Itô in the 1940s, in order to construct the path of diffusion processes (which are continuous time Markov processes with continuous trajectories taking their values in a finite dimensional vector space or manifold), which had been studied from a more analytic point of view by Kolmogorov in the 1930s.

A stochastic differential equation (SDE) is a differential equation in which one or more of the terms is a stochastic process, resulting in a solution which is also a stochastic process.SDEs are used to model various phenomena such as unstable stock prices or physical systems subject to thermal fluctuations.Typically, SDEs contain a variable which represents random white noise calculated as ...

For a time-homogeneous equation, we have an equation that is solved forward in time. Backward Kolmogorov Equation (time-homogeneous). Let X_t solve a time-homogeneous SDE (1). Let $u(x;t)=E_x f(X_t)=E[f(X_t)|X_0=x]$, where $f: \mathbb{R}^d \rightarrow \mathbb{R}$ is bounded with two bounded derivatives. Then $\frac{\partial}{\partial t} u = Lu$; $u(x;0)= f(x)$; $t \geq 0$: (9) Example (Brownian motion).

Lecture 10: Forward and Backward equations for SDEs

we need to consider the backward equation. Let $u(t;x) := E x(t'(X_t))$. Then under certain regularity assumptions one solves a PDE: $u(t+h;x) = E x(E x'(X_{t+h})f(h)) = E x(u(t;X_h)) = E x u(t;X_0) + \int_0^t Lu(t;X_s)ds$ where in the second step we used the Markov property of X , and in the third step we applied Itô's formula to $u(t;X_s)$. Hence $\frac{\partial}{\partial t} u(t;x) = Lu(t;x)$

We consider stochastic zero-sum differential games (SZSDGs) described by fully-coupled forward-backward stochastic differential equations (FBSDEs). The fully-coupled FBSDE means that the drift and diffusion terms of forward SDEs depend on the solution of the backward SDE (BSDE). The objective functional is modeled by the BSDE part of the FBSDE.
