Make a line graph that shows the relationship between the densities of silicon, tin, and lead and the periods in which they are located in the periodic table. Place the number of the period (from 1 to 7) on the horizontal axis and the density (in g/cm. 3) on the vertical axis. Draw a straight line that comes as close as possible to all three points. 10.

1) As you increase the number of electrons, the distance of the outermost electron to the nucleus increases, which decreases the electric force between them by a factor of Δd^2 , and. 2) As the atomic number increases, the "shell" of inner electrons increases in size and number to match all but one proton in the nucleus, effectively shielding the outermost electron from that single positive charge in the nucleus that corresponds to our outermost electron.

You will observe the periodic trends among the representative elements (s and p-blocks) relative to their position on the periodic table. Trends in four important physical properties of elements will be studied (atomic radius, atomic mass, first ionization energy, and electronegativity). This is a graphing lab. You will be making four different graphs.
