Clearly sample size calculations are a key component of clinical trials as the emphasis in most of these studies is in finding the magnitude of difference between therapies. All clinical trials should have an assessment of sample size. In other study types sample size estimation should be performed to improve the precision of our final results.

amend the alpha level for the sample size calculation would be appropriate. For example, in a study involving examination of the difference in means between four groups, there are six possible comparisons, or t-tests, to be examined. If the overall desired alpha level is 0.05 the sample size formula should be reduced to $0.05 / 6 = 0.0083$.

SAMPLE SIZE: HOW MANY IS ENOUGH?

Sample Size Calculators. If you are a clinical researcher trying to determine how many subjects to include in your study or you have another question related to sample size or power calculations, we developed this website for you. Our approach is based on Chapters 5 and 6 in the 4th edition of Designing Clinical Research (DCR-4), but the material and calculators provided here go well beyond an introductory textbook on clinical research methods.

Sample Size Calculators

The sample size required for a non-inferiority clinical trial can be calculated using the formula in Figure 1,. Table 4 gives common Normal deviates for different percentiles. For example, for $\beta = 0.1$, we would have $x = 0.1$ and $Z_{1-x} = 1.282$, while for $\alpha = 0.05$, we would have $x = 0.025$ and $Z_{1-x} = 1.96$.

With the availability of sample size software such as nQuery Sample Size and Power Calculator for Successful Clinical Trials which can calculate appropriate sample sizes for any given power such issues should not be arising so often today. To summarize why sample size is important:

Why is Sample Size important?

Using the formula above, the required sample size per group is 90, and thus the total sample size required is 180. This calculation can also be completed using the nQuery software, by selecting the "Two Sample Z-test" table, and entering the parameters above. The calculation again shows that a sample size of 90 is required in each group.

We will take the usual power and sample size $P = 0.90$, $\alpha = 0.05$, so $f(\alpha, P) = 10.5$. From clinical records we observe 24% of births are by Caesarean section and decide that a reduction to 20% would be of clinical interest. We have $p_1 = 0.24$, $p_2 = 0.20$. The calculation proceeds as follows:
