Per IEEE C57.12.00, normal transformers are designed to handle 110% of rated voltage on the North American System. Interestingly, for wind power transformers, the overvoltage requirement is 115% of rated voltage. However, the frequency is allowed to be a minimum of 95% of rated frequency, resulting in a net volts/Hz allowance of 121% of rated.

A Smart Transformer is a power electronics-based transformer, aiming not only to deliver the voltage conversion function, as typical transformers, but also providing ancillary services to the grid. That includes voltage control at MV and LV, power flow control resulting in capacity sharing between neighboring substations, and also provision of Low Voltage DC supply for direct connection of LCTs.
