Many options exist to replace missing teeth but dental implants have become one of the most used biomaterial to replace one (or more) missing tooth over the last decades. Contemporary dental implants made with titanium have been proven safe and effective in large series of patients. This review considers the main historical facts concerned with dental implants and present the different critical factors that will ensure a good osseo-integration that will ensure a stable prosthesis anchorage.

Dental implants: A review - ScienceDirect

A dental implant (also known as an endosseous implant or fixture) is a

surgical component that interfaces with the bone of the jaw or skull to support a dental prosthesis such as a crown, bridge, denture, facial prosthesis or to act as an orthodontic anchor.

Dental implant - Wikipedia

Dental implants can be used to guide

bone regeneration of the alveolar ridge.

- Biomaterials that deliver osteogenic agents and cells provide the scaffolding to support bone tissue regeneration can be used in place of autograft, and are a key element of alveolar ridge regeneration and long-term dental implant stability. •
