Anatomy And Physiology Tissue Study

A tissue membrane is a thin layer or sheet of cells that covers the outside of the body (for example, skin), the organs (for example, pericardium), internal passageways that lead to the exterior of the body (for example, abdominal mesenteries), and the lining of the moveable joint cavities. There are two

basic types of tissue membranes:
connective tissue and epithelial
membranes (Figure 3).

Types of Tissues | Anatomy and Physiology I

Epithelium consists of closely packed, flattened cells that make up the inside or outside lining of body areas. There is little intercellular material. The tissue is avascular, meaning without blood vessels. Nutrient and waste exchange occurs through neighboring connective tissues by diffusion. The upper surface of epithelium is free, or exposed to the outside of the body or to an internal body cavity.
