Parallel Programming is a form of computation in which program instructions are divided among
 multiple processors (cores, computers) in combination to solve a single problem, thus running a
 program in less time. The single-core and multi-core architectures, along with the instruc-
 tions executions, are highlighted above.

Leveraging Multi-Core Processors Through Parallel Programming

Parallel programming is a broad concept. It can describe many types of processes running on the
 same machine or on different machines. Multithreading specifically refers to the concurrent
 execution of more than one sequential set (thread) of instructions. Multithreaded programming is
 programming multiple, concurrent execution threads. These threads could run on a single processor.
