But how do diesel engines work ? Marine diesels, and diesel engines in general are a 'compression ignition engine'. Air is drawn into the cylinder, and then compressed. This compression of the air is caused by the action of the piston in the cylinder, moving upwards. At an optimal point in this compression of the

air, fuel is injected into the cylinder. The resultant fuel / air mixture ...

Filters are essential to keep water and foreign particles out of your engine. Most marine systems have two fuel filters: a primary filter placed in the fuel lines between the tank and engine, and a secondary filter between the fuel lift pump and the injection pump. Checking and replacing the primary fuel filter. The type of primary filter found on most small boat installations comprises a ...

How to service your marine diesel engine - Practical Boat ...

Most marine engines take their cooling water straight out of the medium they're running in. Consequently, the engines are running quite a bit colder than a car engine. If you're running in the ocean and you get seawater above 180 degrees, it starts desalinating and you end up with a block full of salt and all the steam pockets. They tend to run these engines a lot colder, so the cylinder ...

Most newer marine engines use an enclosed cooling system. This means that there is a small tank on the top of the engine that uses a combination of fresh water and coolant. This fresh water is circulated through the engine and through a heat exchanger. The fresh water, in this system, absorbs the heat of the engine. Raw water is still drawn up through the seacock but only flows through the ...
