The seismic risk owing to future earthquake can be minimize by proper vulnerability assessment of the school structures. To this end, the purpose of the study is to evaluate seismic performance of school structure through both vulnerability and fragility assessment. The main research issues are explored through analytical method.

In accordance with the above definition, seismic fragility analysis can be regarded as a probabilistic measure for seismic performance assessment of structural components or systems. There are two different end products of seismic fragility analysis: damage probability matrix and fragility curve.

Seismic Fragility Analysis | SpringerLink

In recent decades, fragility analysis is emerging to be an impeccable tool for seismic risk assessment of structures. The fragility curves thus developed are empirical conditional probability functions that define the likelihood of exceedance of damage as a function of ground motion parameters with respect to a specific limit state [1].

According to Billah and Alam, the fragility general equation was expressed in Equation (18). (18)Fragility=PLSIM=ywhere LS refers to the damage limit state, IM is the ground motion intensity measure, and Y is the ground motion intensity. Table 17. Fragility curves are essential components of earthquake risk assessments and are developed and used by researchers, civil engineering consultants and insurers. The course brings state of the art techniques and tools to developers of fragility curves, promoting a consistent approach to the inclusion of uncertainty.

Simplified Structural Assessment for Seismic Fragility ...

Fragility curves are an important tool for representing the vulnerability of bridge structures in probabilistic seismic risk assessment. The curves are defined as a function of ground motion intensity parameters, such as peak ground acceleration (PGA) and spectral acceleration (SA), to describe the probability of exceeding a damage state.

Fragility Analysis of a Self-Anchored Suspension Bridge ...

For the purpose of developing analytical fragility relationships, a building typology, representative of the typical school building stock with certain structural configuration, is selected for developing its fragility relationships against seismic loading.

Abstract. The assessment of the seismic behavior of the high-speed railway bridges is necessary because of the strategic essence of these structures. Evaluating and predicting damages of the bridges that originated by earthquakes with various intensities can provide useful information, which is very helpful in the management of the possible crises. One of the most useful mechanisms for estimating earthquake damages to these bridges is the development of fragility curves for them.

Seismic Vulnerability Assessment of High-Speed Railway ...

A seismic fragility curve, or seismic vulnerability curve, is expressed as conditional failure probabilities meeting a predefined damage state criteria for different levels of ground motion intensity (Ellingwood 2001); it shows how well a structure performs during earthquake events as a graphical representation of seismic risk (Rossetto and Elnashai 2003).
