Linux Kernel Module and Device Driver Development ...

In computing, a loadable kernel module is an object file that contains code to extend the running kernel, or so-called base kernel, of an operating system. LKMs are typically used to add support for new hardware and/or filesystems, or for adding system calls. When the functionality provided by a LKM is no longer required, it can be unloaded in order to free memory and other resources. Most current Unix-like systems and Microsoft Windows support loadable kernel modules, although they might use a

Loadable kernel module - Wikipedia

The details of the implementation remain hidden to other kernel subsystems though, and a device driver can just include

<linux/sched.h> and refer to the current process. From a module's point of view, current is just like the external reference printk. A module can refer to current wherever it sees fit.

2. Building and Running Modules - Linux Device Drivers ...

In addition to device drivers, other functionalities, both hardware and software, are modularized in the kernel. Beyond device drivers, filesystems are perhaps the most important class of modules in the Linux system. A filesystem type determines how information is organized on a block device in order to represent a tree of directories and files.

Classes of Devices and Modules - Linux Device Drivers ...

Device files like /dev/tty or /dev/null exist so your program can interface with a driver. A module is a piece of a kernel that can be optionally loaded into the kernel. This is from the perspective of the kernel. CUPS talks about "drivers" while Perl talks about modules.

Is Kernel module is the same as a device driver?

A kernel module is a piece of code that can be added to the kernel at runtime to extend its functionality. Often, device drivers for proprietary devices are provided this way Like the kernel itself, device drivers are written in C89/C90/ANSI C No // comments, no mixed declarations and code, etc.
