The below-mentioned formula represents one-way Anova test statistics. The result of the ANOVA formula, the F statistic (also called the F-ratio), allows for the analysis of multiple groups of data to determine the variability between samples and within samples. The

formula for one-way ANOVA test can be written like this:

Introduction to ANOVA for Statistics and Data Science

In this Lesson, we introduce Analysis of Variance or ANOVA. ANOVA is a statistical method that analyzes variances to determine if the means from more than two populations are the same. In other words, we have a quantitative response variable and a categorical explanatory variable with more than two levels. In ANOVA, the categorical explanatory is typically referred to as the factor.

One-way ANOVA is a test for differences in group means. One-way ANOVA is a statistical method to test the null hypothesis (H_0) that three or more population means are equal vs. the alternative hypothesis (H_a) that at least one mean is different. Using the formal notation of statistical hypotheses, for k means we write: \$

$$H_0: \mu_1 = \mu_2 = \dots = \mu_k$$
