Abstract. Nuclear waste must be stored in a safe and consistent manner among the nation states. Given the myriad of types of waste generated through civilian applications of radionuclides in medicine, research, and industry, it is important to understand the creation of the waste classification system and its use among the nation states in handling and storage of nuclear waste.

Nuclear forensics is the investigation of nuclear materials to find evidence for the source, the trafficking, and the enrichment of the material. The material can be recovered from various sources including dust from the vicinity of a nuclear facility, or from the radioactive debris following a nuclear explosion. Results of nuclear forensic testing are used by different organisations to make decisions. The information is typically combined with other sources of information such as law enforcement
