We use two main techniques to detect malware: API call sequence in SAVE and Assembly in MEDiC. These techniques will be discussed in Sects. 4 and 5, respectively, along with the analysis and the results. We also provide our conclusions and future work in Sect. 6. 2 Related Work

Malware detection using assembly and API call sequences

A malware detector is a system that attempts to determine whether a program has malicious intent. Current malware detectors work by checking for signatures, which attempt to capture the syntactic characteristics of the machine level byte sequence of the malware. This syntactic approach makes current detectors vulnerable to code obfuscations, increasingly used by malware writers that alter the syntactic properties of the malware byte sequence without significantly affecting their execution ...

Malware Detection Using Assembly And Api Call Sequences

Ding et al. , proposed a malware-detection method using a control flow analysis, which created an execution tree from a binary file and extracted the possible execution paths. Then, using a 2-gram analysis, along with the information gain and document frequency, the opcode sequence feature that contributed most to the malware detection was chosen.

Malware-Detection Method with a Convolutional Recurrent ...

Malware detection can be simply considered as a binary classification problem, and traditional anti-virus software usually relies on static signature-based detection method , which has a significant limitation. some minor changes in malware can change the signature, so more malware could easily evade signature-based detection by encrypting, obfuscating or packing. Meanwhile, the zero-day malware can also evade this detection approach.
