Writing Device Drivers For Sco Unix A Practical Approach

Writing Unix Device Drivers (Book
Review) If you are going to do SCO Unix
driver development (I won't ask why)
you need their Hardware Developers Kit,
which includes documentation and
sample drivers. One thing that comes up
in this context is dual ported ram
because apparently it's handled

differently in all operating systems.

Understanding SCO Unix Device Drivers

A SCO client profile driver is a profile driver that requests Synchronous Connection-Oriented (SCO) connection to a remote device. If the device accepts the connection, the SCO client profile driver is notified of any changes to the connection. For example, a SCO client profile driver can request a connection to a remote headset, and after the headset accepts the connection request, the Bluetooth driver stack can notify the profile driver when the headset is turned off or removed.

The “parlelport” driver: writing to the device. Again, you have to add the “writing to the device” function to be able to transfer later this data to user space. The function outb accomplishes this; it takes as arguments the content to write in the port and its address. = /* Writing to the port */
outb(parlelport_buffer,0x378);

Writing device drivers in Linux: A brief tutorial

Writing a device driver can be pretty simple, or it can be almost arbitrarily complicated. For instance, I've been

involved in a project where it took six of us almost three years to solve ONE bug in a device driver. Of course, we cleared out dozens of other bugs while looking for it... the code improved immensely.
