So to get rid of this problem, I came up

with a "Smart Plant Watering System Using Arduino Uno". This system water to the plant only at daytime whenever the soil is dry. In this system, I have used a soil moisture sensor to sense the moisture level of the soil, a light dependent resistor to identify daylight, water pump, and Arduino Uno.

Smart Plant Watering System Using ARDUINO UNO

Our Arduino Automatic Smart Plant Watering Kit is based on Arduino Lenardo which has integrated into the mainboard. We add a RTC to set timing watering and a 0.96 inch OLED to show the time and the soil moisture status. The kit includes a pump, capacitive soil moisture

sensors, water switch to redirect the water to up to 4 plants and pipes for the water to go through.

The Arduino is connected to a moisture sensor and relay via a breadboard. The Moisture sensor takes multiple readings from the soil each minute and when the moisture content drops below the pre-set value the relay is triggered sending 12v to the water pump. The power is cut again when the moisture sensor reads a value greater than 70% content.

Arduino Automatic Watering System : 5 Steps - Instructables

The circuit diagram of the automatic plant watering system is shown in Fig. 2. The circuit comprises an Arduino UNO board, a soil moisture sensor, a servo motor, a 12V water pump and an L293D (IC1) motor driver IC to run the water pump. You can

power the Arduino board using a 7V to 12V wall wart or plug-in adaptor or solar panel.

Arduino is used for controlling whole the process of this Automatic Plant Watering System. The output of soil sensor circuit is directly connected to digital pin D7 of Arduino. A LED is used at the sensor circuit, this LED's ON state indicates the presence of moisture in the soil and OFF state

indicates the absence of moisture in the soil.

You can start watering, but it may take say ten minutes for the water to reach your sensor, by when you have totally over watered the bed. So don't start watering until your reading is too low for a period of time, then water for a short time (so timing based rather than waiting for your sensor to react), wait, and water again if

needed.
