While the freezing point of pure glycol is only -39° F, the synergy between glycol and water results in a much lower freezing point. This is very important for closed-loop systems that may be exposed to freezing conditions. What is the difference between freeze protection and burst protection? As the temperature of the water-glycol solution falls, the water will begin to freeze and “precipitate” out of the solution, causing the fluid to become slushy.

Pure ethylene glycol has a freezing point of −12.9°C, and water's freezing point is 0°C. So, the solution's freezing point should actually be below 0°C (what occurs is freezing point depression due to colligative properties of adding solutes into a solvent, so the freezing point should drop). We can eliminate all but B, −20.1°C.
