Design Against Blast: Load Definition & Structural Response. Design Against Blast. : Terrorist attacks and other destructive incidents caused by explosives have, in recent years, prompted considerable research and development into the protection of structures against blast loads. For this objective to be achieved, experiments have been performed and theoretical studies carried out to improve our assessments of the intensity as well as the space-time distribution of the resulting blast ...

Blast loads are dynamic, impulsive and non-simultaneous over the length of a roof. To design against explosions, a procedure has been developed to devise a uniform dynamic load on a roof that matches the response from blast loads.

Blast Loading and Its Effects on Structures

the effect of blast loads on buildings is a serious matter that should be taken into consideration in the design process. Although these kinds of attacks are exceptional cases, man-made disasters; blast loads are in fact dynamic loads that need to be carefully calculated just like earthquake and wind loads.

DESIGN AND ANALYSIS OF BLAST LOAD ON STRUCTURES

The objective of this paper is to crystallize blast resisting design in architectural and structural points of view by impending some fundamental changes and additional features to the standard plan of a building. The behavior of the structure is abnormal when the blast occurs depending on the magnitude and location of the explosion takes place.

BUILDING DESIGN ASPECTS AND BLAST LOAD DETERMINATION ...

The capacity of the frame system to resist blast loading should therefore exceed the corresponding capacity of the glazing, often referred to as the "glass fail first criteria." Factors of two to three, over the nominal capacity of the glass to resist breakage, may be required to design the frames.

Standards for the blast load design use a two-level design load definition, which is like the requirements for the seismic design (e.g. see ABS [1]). In principle, there is not much difference between various standards, but they use different terminologies for the same purpose. The current UK practice uses two-level explosion design loads, one with a higher frequency

Design Accidental Load for Explosion Resistant Design

The analysis and design of structures subjected to blast loads require a de-tailed understanding of blast phenomena and the dynamic response of various structural elements. This paper presents a

comprehensive overview of the effects of explosion on structures. An explanation of the nature of explosions and the mechanism of blast waves in free air is given.

Blast Loading and Blast Effects on Structures - An Overview

2. Design of Blast-Loaded Windows. The design of the protection of critical infrastructure (in particular where glass elements are of concern) against terrorist attacks is usually done along the following lines: (i) The first step is to determine scenarios. This is a joint decision of the owner or

stakeholder and the designer.

Industry-accepted methods for the design of glazing to resist blast loading are published for the first time, as well as a new chapter on hostile vehicle mitigation techniques. Guidance on structural steelwork and reinforced concrete design is extended and enhanced, supplemented with material on design in new materials such as steel-concrete-steel composites, this latter addition being published for the first time.
