Adipose tissue is the body's loose connective tissue that contains adipocytes or lipocytes, which are fat cells, under the skin and around internal organs. These fat cells store energy and provide insulation. They also contain stem cells that have an innate ability to regenerate tissues and bone, like the stem cells found in bone marrow. However, adipose tissue typically contains a much higher volume of progenitor, or mesenchymal, stem cells than a bone marrow sample of the same size—and ...

Why Do We Use Adipose Stem Cells in Regenerative Medicine ...

Adipose Tissue-Derived Stem Cells in Regenerative Medicine. Aug 27, 2018 | Adipose, Stem Cell Research, Stem Cell Therapy. Regenerative medicine is a field of research concerned with the process of replacing diseased, dying, or dead cells with the intent of restoring structure and function. In its most basic form, regenerative medicine seeks to regrow cells that were lost or damaged due to injury or condition.

The Potential of Adipose Stem Cells in Regenerative Medicine

The article that I have chosen as a target is called “Adipose stem cells: Biology and clinical applications for tissue repair and regeneration” (Kokai, Marra, & Rubin, 2014). It tells about how biology can help people solve such significant problems as tissue regeneration and recovery from serious injuries.

This article presents the stem and progenitor cells from subcutaneous adipose tissue, briefly comparing them with their bone marrow counterparts, and discussing their potential for use in regenerative medicine.

Adipose stromal/stem cells in regenerative medicine ...

The benefits of adipose stem cell therapy include: High Volume of Healing Cells: Studies have shown that adipose tissue may contain as many as 500 times the number of regenerative cells than an equivalent volume of bone marrow aspirate. Age-Resilient: Fat cells maintain certain reparative

properties regardless of a person's age. Bone marrow derived cells may lose their healing capacity with age.

What is Adipose Stem Cell Therapy? - San Diego ...

Compared with the extraction of other stem cells such as bone marrow-derived mesenchymal stem cells (BMSCs), that of ADSCs requires minimally invasive techniques. In the field of regenerative medicine, the use of autologous cells is preferable to embryonic stem cells or induced pluripotent stem cells.

The emerging field of regenerative medicine will require a reliable source of stem cells in addition to biomaterial scaffolds and cytokine growth factors. Adipose tissue represents an abundant and accessible source of adult stem cells with the ability to differentiate along

multiple lineage pathways.

Adipose-Derived Stem Cells for Regenerative Medicine ...

One particularly new and enticing addition to the types of known stem cell sources is the pool of adipose-derived stem cells (ADSCs). ADSCs are found in the perivascular region of white adipose tissue, which include subcutaneous fat deposits [3, 4]. Because of their abundance, ease of isolation, and noncontroversial nature, ADSCs have been considered for applications in regenerative medicine.

Among various stem cell types, adipose-derived stem cells (ASCs) are especially considered to be an ideal stem cell population for several clinical situations. These cells could be harvested from fat with relatively less invasive methods with high yield rates.

Multipotency and secretome: the mechanisms behind the ...

The fact that stem cell yields are greater from adipose tissue than from other stem cell reservoirs is another significant factor in their suitability for use in regenerative medicine. Routinely, 1×10^7 adipose stromal/stem cells have been isolated from 300 ml of lipoaspirate, with greater than 95% purity .
