Material: Gallium Arsenide (GaAs), bulk

Gallium arsenide It is a III-V direct band gap semiconductor with a zinc blende crystal structure. Gallium arsenide is used in the manufacture of devices such as microwave frequency integrated circuits, monolithic microwave integrated circuits, infrared light-emitting diodes, laser diodes, solar cells and optical windows. GaAs is often used as a substrate material for the epitaxial growth of other III-V semiconductors,

including indium gallium arsenide, aluminum gallium arsenide and others.

Gallium arsenide - Wikipedia

The problem of chromium outdiffusion has been eliminated through a combination of reducing the background carbon concentration and precise control of the stoichiometry during the growth of bulk GaAs to produce undoped semi-insulating (10^7 - $10^8 \Omega\text{-cm}$) GaAs. The growth stoichiometry controls the EL2 deep-donor density, which compensates the remaining background carbon acceptor concentration.

We speculate that the slight reduction in value for the LO phonon energy, compared to bulk zinc blende GaAs, may be the result of wurtzite segments in our polytypic nanowires. 59-61 Thus, the temperature dependence of both the electron mobility and PL FWHM indicate that at room temperature the primary scattering mechanism in our modulation doped nanowires arises from LO phonons.
