Visualization is the creation of visual representation of an image or data. Several visual design techniques are used for the visualization of natural image statistics. The visual design techniques such as PCA, KPCA, FPS5 have seen to be ineffective in denoising and this also increases the complexity of natural image statistics. By introducing foGSM, the effectiveness in denoising can be improved.

The main properties of a good image denoising model is that it will remove noise while preserving edges. conventionally, linear models have been used. One common approach is to use filters. For some purposes this kind of denoising is satisfactory. One big advantage of linear noise removal models is the speed.

To cope with the problem of distorting or altering the original noise-free image in denoising process, Luo et al. proposed the averaging reconstructed images based denoising method for MR images. The reconstruction can reduce noise while preserve useful information: the averaging of the reconstructed images allows by mimicking time averaging mechanism, the reconstruction errors and noise to be further reduced, the approach first divides the spectrum of the image to be denoised into different ...

LMS Adaptive Filter: Adaptive filters are capable of denoising non-stationary images, that is, images that have abrupt changes in intensity. Such filters are known for their ability in automatically tracking an unknown circumstance or when a signal is variable with little a priori knowledge about the signal to be processed [20].An adaptive filter does a better job of denoising images compared to the averaging filter as the Least Mean Square (LMS) adaptive filter is known for its simplicity ...
