Rate of Reaction - Definition and Factors Affecting ...

In a zero order reaction, the rate= k since anything to the power of 0 is 1. Therefore the rate of reaction does not change over time and the $[A]$ (for example) changes linearly. In a first order reaction, the rate and concentration are proportional. This means that if the concentration is doubled, the rate will double.

Reaction rate - Wikipedia

The reaction rate calculated for the reaction $A \rightarrow B$ using Equation $\left(\frac{d[A]}{dt}\right)$ is different for each interval (this is not true for every reaction, as shown below). A greater change occurs in $[A]$ and $[B]$ during the first 10 s interval, for example, than during the last, meaning that the reaction rate is greatest at first.

14.2: Reaction Rates - Chemistry LibreTexts

the reaction rate is described by $= k[A]$, where k is a unimolecular rate constant. Since a reaction requires a change in molecular geometry, unimolecular rate constants cannot be larger than the frequency of a molecular vibration. Thus, in general, a unimolecular rate constant has an upper limit of $k_1 \leq \sim 10^{13} \text{ s}^{-1}$. For a bimolecular step $A + B \rightarrow P$

A general rule for most (not all) chemical reactions is that the rate at which the reaction proceeds will approximately double for each 10-degree Celsius increase in temperature. Once the temperature reaches a certain point, some of the chemical species may be altered (e.g., denaturing of proteins) and the chemical reaction will slow or stop.
