In solid-state physics, a band gap, also called an energy gap, is an energy range in a solid where no electronic states can exist. In graphs of the electronic band structure of solids, the band gap generally refers to the energy difference (in electron volts) between the top of the valence band and the bottom of the conduction band in insulators and semiconductors.

In ordered solids, the atomic spacing between two bonded atoms is generally around a few ångströms (Å), which is on the order of 10^{-10} meters. However, in very low density gasses (for example, in outer space) the average distance between atoms can be as large as a meter. In this case, the atomic spacing

isn't referring to bond length.

The separation distance depends in turn on the molar mass and measured density. We can determine the separation distance, and then use this value to determine the dissociation energy for one mole of the solid.
