Momentum is defined as the mass of an object times its velocity. Since mass is a scalar and velocity is a vector the product is a vector in the same direction as the velocity. The concept of momentum is used in two general types of problems, impulse& momentum solutions of Newton's 2nd law type problems and conservation of momentum problems.

Which is known as the impulse-momentum theorem. In component form, we have $\triangle p_x = I_x$, $\triangle p_y = I_y$, and $\triangle p_z = I_z$. That is, the impulse of a force that acts on a particle during a time interval is equal to the change in the momentum of the particle during that interval. The direction of the impulse is in the same direction as the change of momentum.

This equivalence is known as the impulse-momentum theorem. Because of the impulse-momentum theorem, we can make a direct connection between how a force acts on an object over time and the motion of the object. One of the reasons why impulse is important and useful is that in the real world, forces are often not constant.
