$K_a \times K_b = K_w$ (for conjugate acid-base pair) It is important to note that the method to find pH of a salt solution is to deduce that one of the ions is a conjugate base (in this example), which is also a weak base. So the method to find the pH of sodium ethanoate is nothing more than finding the pH of a weak base.

Acid/Base Properties of Salt Solutions

Ionic compounds, commonly called salts, may cause a pH change when added to water. The way that salts change the pH of a solution can be predicted. In this activity, you will predict whether the pH of a solution will be acidic, basic, or neutral based on the formula of the salt being added. How can the pH of the salt be predicted?

Salts that are from strong bases and weak acids do hydrolyze, which gives it a pH greater than 7. The anion in the salt is derived from a weak acid, most likely organic, and will accept the proton from the water in the reaction. This will have the water act as an acid that will, in this case, leaving a hydroxide ion (OH⁻).

Solubility is the property of a solid, liquid or gaseous chemical substance called solute to dissolve in a solid, liquid or gaseous solvent. The solubility of a

substance fundamentally depends on the physical and chemical properties of the solute and solvent as well as on temperature, pressure and presence of other chemicals (including changes to the pH) of the solution.
