Structure Based Design Of Drugs

Structure-based drug design is a powerful method, especially when used as a tool within an armamentarium, for discovering new drug leads against important targets. After a target and a structure of that target are chosen, new leads can be designed from chemical principles or chosen from a subset of small molecules that scored well when docked in silico against the target.

The Process of Structure-Based Drug Design - ScienceDirect

Structure-based design is important not only in attaining the goal of discovering drugs that progress to the clinic and regulatory approval for patient benefit, but also in the search for potent, selective and cell-permeant chemical probes that can be used with confidence to explore the mechanistic biology of healthy and diseased cells.

A promising drug target is the viral main protease Mpro, which plays a key role in viral replication and transcription. Dai et al.

designed two inhibitors, 11a and 11b, based on analyzing the structure of the Mpro active site. Both strongly inhibited the activity of Mpro and showed good antiviral activity in cell culture.

Severe acute respiratory syndrome coronavirus (SARS-CoV) main protease (M pro), a protein required for the maturation of SARS-CoV, is vital for its life cycle, making it an attractive target for structure-based drug design of anti-SARS drugs. The structure-based virtual screening of a chemical database containing 58 855 compounds followed by the testing of potential compounds for SARS-CoV M pro inhibition leads to two hit compounds. The core structures of these two hits, defined by the ...

RECEPTOR BASED DRUG DESIGN Another category of structure-based drug design methods is about “building” ligands, which is usually referred as receptor- based drug design. In this case, ligand molecules are built up within the constraints of the binding pocket by assembling small pieces in a stepwise manner. These pieces can be either individual atoms or molecular fragments. The key ...

De novo design attempts to use the unliganded structure of the protein to generate novel chemical structure that can bind. There are varying algorithms, most of which depend on identifying initial putative sites of interaction that are grown into complete

ligands. Fragment based discovery is based on the premise that most ligands that bind strongly to a protein active site can be considered as a number of smaller fragments or functionalities. Fragments are identified by screening a relatively ...

Identifying the drug target The majority of available drugs have protein molecules as their targets. Although nucleic acids may also be considered, their use as drug targets in drug discovery and structure based drug design has been limited due to various effects like toxicity, difficulty in achieving high specificity, etc.

Structure-Based Drug Discovery and Drug Design

Structure-based drug design attempts to use the structure of proteins as a basis for designing new ligands by applying the principles of molecular recognition. Selective high affinity binding to the target is generally desirable since it leads to more efficacious drugs with fewer side effects.

Drug design - Wikipedia

Structure-based drug design is now a common method used by the pharmaceutical industry to identify a lead compound and

take it forward for further development. Adam Todd, Roz Anderson and Paul W. Groundwater describe the methods used to identify and characterise a target for structured drug design and illustrate how pharmacists can play an important role in this process.
