Metals: Solid metals include elements (e.g., silver) and alloys (e.g., steel). Metals are typically hard, ductile,... Ceramics: Ceramics are solids ...

The Definition of a Solid in Chemistry and Science

Some solids are composed of atoms of one or more elements that are covalently bonded together in a seemingly never-ending fashion. Such

solids are called covalent network solids. Each piece of the substance is essentially one huge molecule, as the covalent bonding in the crystal extends throughout the entire crystal.

Solids - Introductory Chemistry - 1st Canadian Edition

Solids exhibit certain characteristics that distinguish them from liquids and gases. All solids have, for example, the ability to resist forces applied either perpendicular or parallel to a surface (i.e., normal or shear loads, respectively). Such properties depend on the properties of the atoms that form the solid, on the way those atoms are arranged, and on the forces between them.

solid | Definition & Facts | Britannica

Covalent molecules held together by intermolecular forces form molecular solids. While the intermolecular forces are strong enough to hold the molecules in place, molecular solids typically have lower melting and boiling points than metallic, ionic, or network atomic solids, which are held together by stronger bonds.

Types of Solids and How to Categorize Them

There are five main types of solids, each of which has its own properties and structures. Let's have a look. Ionic Solids. As we discussed at great length in Ionic Compounds, ionic solids consist of cations and anions held together by the strength of their opposite charges.

The force that holds oppositely charged particles together is called an "electrostatic force."
