Periodic trends affect bonding, because of how the elements are arranged on the periodic table. For example elements can be arranged by their electronegative, electron affinity, atomic radius, or ionization energy. Electronegative is the atoms ability to attract other bonded atoms. Electron affinity is an atoms ability to attract another atom.

22.1: Periodic Trends in Bonding - Chemistry LibreTexts

Chemical bond formation stems from the transfer or sharing of electrons, and so the energy required to remove an electron is a crucial criterion in the ability of an atom to form a bond. In broad terms, the variation of ionization energies throughout the periodic table mirrors the variation in atomic radii, with small atoms typically having high ionization energies and large atoms usually having small ones.

Depending on where an atom is found on the Periodic Table, it forms different kinds of bonds, and has a different level of reactivity than others. Elements found of group 5, 6, and 7 are highly electronegative, they want to gain electrons so that they can compete their outer orbitals. This makes them very reactive.

Atoms form chemical bonds to make their outer electron shells more stable. The type of chemical bond maximizes the stability of the atoms that form it. An ionic bond, where one atom essentially donates an electron to another, forms when one atom becomes stable by losing its outer electrons and the other atoms become stable (usually by filling its valence shell) by gaining the electrons.

In Lewis terms, the formation of an ionic bond stems from the transfer of electrons from one atom to another. When such a transfer occurs, all the valence electrons on the more electropositive element (from one of the first three groups on the left in the periodic table) are removed to expose the core of the atom.

Bonded atoms vibrate due to thermal energy available in the surroundings. Bond lengths are typically in the range of 100-200 pm (1-2 Å). As a general trend, bond length decreases across a row in the periodic table and increases down a group. Atoms with multiple bonds between them have shorter bond lengths than singly bonded ones.
