A satisfactory theory of these reactions was proposed by F. A. Lindemann in 1922. Theory of unimolecular reactions (Book, 1973) [WorldCat.org]

The master equation of thermal unimolecular reactions in the fall-off range has been solved for a number of representative molecular systems. Weak collision broadening factors FWC (k_0 / k_∞) are derived and represented empirically. Weak collision efficiencies β_c for the low pressure range are calculated for very high temperatures.

In chemical kinetics, the Lindemann mechanism is a schematic reaction mechanism for unimolecular reactions. Frederick Lindemann and J. A. Christiansen proposed the concept almost simultaneously in 1921, and Cyril Hinshelwood developed it to take into account the energy distributed among vibrational degrees of freedom for some reaction steps. It breaks down an apparently unimolecular reaction into two elementary steps, with a rate constant for each elementary step. The rate law and rate equation

Until about 1921, chemists did not understand the role of collisions in unimolecular processes. It turns out that the mechanisms of such reactions are actually quite complicated, and that at very low pressures they do follow second-order kinetics. Such reactions are more properly described as pseudounimolecular. The cyclopropane isomerization described in Example 1 is typical of many decomposition reactions found to follow first-order kinetics, implying that the process is unimolecular.

Therefore the rate of production of A^* (first term in Equation 29.6.3) equals the rate of consumption (second and third terms in Equation 29.6.3):

The Rice–Ramsperger–Kassel–Marcus theory is a theory of chemical reactivity. It was developed by Rice and Ramsperger in 1927 and Kassel in 1928 and generalized in 1952 by Marcus who took the transition state theory developed by Eyring in 1935 into account. These methods enable the computation of simple estimates of the unimolecular reaction rates from a few characteristics of the potential energy surface.

The quantum tunneling contribution to the reaction rate constants is calculated using the semiclassical transition state theory (SCTST) developed by Miller and co-workers. 26–31 The SCTST calculates the overall quantum tunneling probability by summing over a series of TS vibrational configuration-dependent tunneling probabilities.
