When a cell needs to make a protein, say the enzyme to digest lactose (the sugar in milk), it needs to use/read the DNA code to make proteins. We call this process protein synthesis. Protein synthesis requires the use of DNA and all three forms of RNA to read the code and make the desired protein. This occurs in two steps: Transcription; Translation

Protein Synthesis - Easy Peasy All-in-One High School

Protein synthesis is a two-step process that involves two main events called transcription and translation. In transcription, the DNA code is transcribed (copied) into mRNA. Once the mRNA is produced it moves out of the nucleus into the cytoplasm where it links up with ribosomes (protein making organelles) and begins churning out proteins. Before looking at translations let's take a closer look at transcription.

Making Proteins | Biology I Laboratory Manual

Overview of the Translation (Protein Synthesis) The ribosomal translation is initiated when the ribosomes recognize the starting point of mRNA, where it binds a molecule of tRNA that bears a single amino acid. In prokaryotes, the initial amino acid in N-formylmethionine. during elongation, the second amino acid is linked to the first one.

Protein Synthesis | NOVA Labs | PBS

Protein synthesis is accomplished through a process called translation. After DNA is transcribed into a messenger RNA (mRNA) molecule during transcription, the mRNA must be translated to produce a protein. In translation, mRNA along with transfer RNA (tRNA) and ribosomes work together to produce proteins. Stages of Translation in Protein Synthesis

Protein Synthesis-Transcription and Translation: Transcription: DNA RNA Transcription is the synthesis of mRNA. DNA contains the “code” for a specific amino acid sequence. The DNA molecule unzips and a single strand of messenger RNA (mRNA) is assembled using the sequence of one of the DNA strands. Messenger RNA (mRNA), which is synthesized in the nucleus using the DNA code as a template, carries the code (like a messenger) out of the nucleus and into the cytoplasm of the cell.

The translation of DNA into RNA is termed transcription; protein synthesis from RNA templates is called translation. Details on gene expression and transcription can be found in a separate article. Translation is carried out by ribosomes, which are large molecular complexes of ribosomal RNA (rRNA) and proteins.
