In fluids, heat is often transferred by convection, in which the motion of the fluid itself carries heat from one place to another. Another way to transfer heat is by conduction, which does not involve any motion of a substance, but rather is a transfer of energy within a substance (or between substances in contact).

05 Heat Transfer & its Applications

Heat transfer processes are classified into three types. The first is conduction, which is defined as transfer of heat occurring through intervening matter without bulk motion of the matter. Figure 1.1 shows the process pictorially. A solid (a block of metal, say) has one surface at a high temperature and one at a lower

temperature.

PART 3 INTRODUCTION TO ENGINEERING HEAT TRANSFER

Jean-Paul Duroudier, in Heat Transfer in the Chemical, Food and Pharmaceutical Industries, 2016. 3.1 General points 3.1.1 Purpose of finned tubes. The heat transfer coefficient obtained by forced convection on a wall is considerably higher for a liquid than for a gas. This imbalance can be corrected by changing the form of the wall separating liquid and gas, so that the face in contact with the gas has a much larger surface area than the face in contact with the liquid.
