High Temperature Guarded Hot Plate

The guarded hot plate (GHP) apparatus is the most common type of absolute apparatus for measurement of the thermal transmission properties of thermal insulation. As the name implies, the hot meter plate is surrounded by a coplanar guard plate, separated by a narrow guard gap, that is held at a

temperature close to that of the meter plate so as to promote one-directional heat flow through the test specimen (s) that are located on one or both sides of the hot plate.

The prototype 305-mm GHP apparatus used one circular line-heat-source in the meter plate and one in the guard plate. The later one-meter GHP apparatus used a single circular line-heat-source in the meter plate but two such heaters in the guard plate. NIST is now completing the fabrication of a third GHP apparatus, to cover a much broader temperature range than achievable by the previous designs, that utilizes multiple line-heat-sources in the meter plate, the guard plate, and the cold plates.

Development of the guarded hot plate (GHP) apparatus started in the early 20th century, and was influenced by the Lees Disk method reported in 1898 by English scientist Lees. It is generally well accepted that the GHP apparatus was developed nearly concurrently in the United States and Germany. A request by the American Society of Refrigerating Engineers in 1910 to the National Bureau of Standards (NBS) was what sparked the development of the GHP apparatus in the United States.
