The hypothesis has been proven after the experiment. The activity series were correctly found for the metals Magnesium, Zinc, Lead, and Cupper and, the halogens Chlorine, Bromine, and Iodine by performing a series of reactions. This lab has almost a hundred percent accuracy since all the data found had matched the actual activity series.

When an atom gains electrons, it is reduced. Metals higher on the activity series are more likely to react relative to those lower on the activity series. The activity series can be used to predict products of reactions, and to predict if a reaction will even occur. In this experiment, different metals were tested for their reactivity. It was recorded if a reaction occurred or not, so that an activity series could be created. Data & Results
