Physics Circular Motion Study Guide

Uniform circular motion assumes that an object is moving (1) in circular motion, and (2) at constant speed ; then $T = \frac{2\pi r}{v}$ where r is the radius of the circular path, and T is the time period for one revolution.

In order to make an object follow a circular path, a force must constantly push the object towards the centre of that circle in order to keep it changing direction. The Moon is pulled towards the Earth. This causes it to travel in a circular path. This inwards resultant force is called the centripetal force.

Circular Motion | Edexcel GCSE Physics Revision Notes

The process of solving a circular motion problem is much like any other problem in physics class. The process involves a careful reading of the problem, the identification of the known and required information in variable form, the selection of the relevant equation(s), substitution of known values into the equation, and finally algebraic manipulation of the equation to determine the answer.

Circular motion is the motion of a

particle at a set distance (called radius) from a point. For circular motion, there needs to be a force that makes the particle turn. This force is called the 'centripetal force.' Please note that the centripetal force is not a new type of force-it is just a force causing rotational motion. To make this clearer, let us study the following examples:
