Introduction. Deep Venous Insufficiency (DVI) is a chronic disease that can result in significant morbidity. It is commonly caused by either deep vein thrombosis (DVT) or valvular insufficiency, and together with varicose veins (in the superficial venous system) it is part of chronic venous insufficiency. Deep Venous Insufficiency occurs as a result of a failure of the venous system, characterised by valvular reflux, venous hypertension and obstruction*.

Technology and Medicine, London, UK. The term chronic venous disorder (CVD) is used to denote all abnormal clinical changes that result from venous disease of the lower extremities, and that have a chronic course.¹ According to this definition, CVD includes patients who present with so-called symptoms and/or signs of venous disease that

characterize each class of CVD in the Clinical, Etiological, Anatomical, Pathophysiological (CEAP) classification, 2 from class C0s to class C6.

Pharmacological treatment of chronic venous disorders ...

Among people who have had a DVT, one third to one half will have long-term complications (post-thrombotic syndrome) such as swelling, pain, discoloration, and scaling in the affected limb. One-third (about 33%) of people with DVT/PE will have a recurrence within 10 years.
